WIRELESS COMMUNICATIONS DEVICE AND METHODFOR USE WITH TELEPHONE NETWORK EDGE NODE PROVIDING BRIDGING AND PRIVACY

ABSTRACT

A wireless device connects to one or more network node devices that are in turn connected to one or more wirelines. The wireless device has one or more wireless signal generators supporting one or more of the wireless connections and one or more memories to store an identifier. One or more negotiators negotiate with the network node device in order to establish a connection to one or more wirelines connected to the network node and a requesting process requests bridging to a call in progress.
